

ROTADYNE

POST PROCESSING

WHAT WE DO

1 TRIMMING

Excess plastic is removed for a smooth, professional finish.

2 PRESSURE TESTING

For tanks and containers, we ensure the part can withstand the pressure required to safely hold its contents and check for leaks.

3 POLISHING + FLAMING

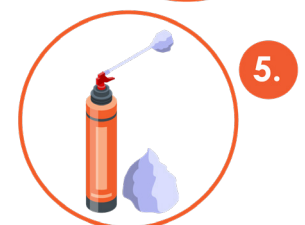

We clean and polish your parts, and can also flame the part for a clean look.

4 DRILLING

Necessary holes and threads are drilled into your part, for both user end purposes and to prepare for assembly.

5 FOAMING

Foam is optionally injected into hollow parts to provide insulation for heat, noise, and to improve buoyancy of the product.

BENEFITS

Post processing means that you never receive half-done jobs. This process is important to achieve a professional, quality finishing, and to have confidence on the functionality and security of your product in use.
